

Does LMX always promote employee voice? A dark side of migrant working in Saudi Arabia

Ghulam Ali Arain, Zeeshan Bhatti, Jonathan Crawshaw, Imran Ali & Armando Papa

Abstract

Purpose: Drawing on the self-consistency theory, we tested a model where employees' supervisor-based self-esteem (SBSE) is positively related to their promotive and prohibitive voice. The model also suggested that SBSE mediates the positive relationship between leader-member exchange social comparison (LMXSC) of an employee's promotive and prohibitive voice, but these relationships are weakened for migrant workers.

Design/Methodology: To test our hypotheses, multi-source data were collected from 341 matched supervisor-supervisee dyads working in a diverse range of organizations in the Kingdom of Saudi Arabia (KSA). We carried out this study in the context of a unique work environment created in KSA as a result of the recent policies of the government.

Findings: As predicted, employees' SBSE is positively related to their promotive and prohibitive voice and mediates a positive relationship between their LMXSC and their promotive and prohibitive voice, but only for local workers.

Originality: Our study responds to calls for more research that explores the roles played by macro-environmental factors on employees' voice. Implications for theory and practice are discussed.

Keywords: Leader-Member Exchange Social Comparison; Self-Esteem; Voice; Migrant Workers; The Kingdom of Saudi Arabia (KSA).

Does LMX always promote employee voice? A dark side of migrant working in Saudi Arabia

1 Introduction and research goals

Employee voice, which is a voluntary, constructive, and often challenging, upward communication of work-related ideas and issues to the management by employees, has been acknowledged as a significant predictor of individual, team and organizational effectiveness (Liang *et al.*, 2012; Kong *et al.*, 2020). It is a key source of team and organizational learning as well as innovation as it allows firms to change and adapt organization settings and survive efficiently and effectively (Del Giudice *et al.*, 2014; Morrison, 2014). The absence of employee voice can result in significant organizational failures, such as the implosion of Enron in 2001 and the crash of space shuttle Columbia in 2003 (Morrison, 2014). Considering the importance of employee voice in organizations, research has explored a wide range of employees' dispositional, attitudinal, behavioral, and contextual factors that may motivate or inhibit their constructive voice behaviors in organizations, see meta-analysis by Chamberlin *et al.* (2017).

Among the behavioral antecedents of employee voice, the role of a supervisor's leadership behavior has been of considerable interest. An emerging literature has consistently reported that supervisors' transformational- (Detert and Burris, 2007), ethical- (Walumbwa and Schaubroeck, 2009), servant- (Arain *et al.*, 2019b) leadership behaviors, and/or leader-member exchange (LMX) quality (Duan *et al.*, 2019) are important motivators for subordinates' constructive voice behavior as well as identification and organizational meaningfulness (Lythreathis *et al.*, 2020). Conversely, supervisors' negative leadership behavior –such as abusive supervision (Ouyang *et al.*, 2015)– is

considered to be a significant inhibitor of the subordinates' constructive voice behavior. In exploring these findings further, a recent meta-analysis by Chamberlin *et al.* (2017) compared the effect sizes of such leadership behaviors on employees' promotive and prohibitive voice, and highlighted LMX as the most influential motivator of these constructive voice behaviors. Chamberlin *et al.* (2017) called for further inquiry and explore the contextual boundary conditions of the relationships between LMX and promotive and prohibitive voice (where promotive voice refers to employees' suggestions and ideas for improvement, and prohibitive voice refers to their concerns for past or ongoing problems that, if left unchecked, can harm the organization) (Liang *et al.*, 2012). This is especially true during challenging times, when the combination of disruptive technology and the Covid-19 health crisis do mark the importance for organizations to being resilient enhancing human-technology interaction across collaborative work behaviours (Behl, 2020; Pereira *et al.*, 2020)

Past research on the antecedents of "voice" is mostly conducted in the Western work context, while little to no research has been conducted in the Middle-Eastern context. Given the work contexts significantly differ from each other, such as the former does not discriminate between local and migrant workers, whereas the later discriminates by providing more job security and legal protection against workplace mistreatment to local workers than the migrant workers (Arain *et al.*, 2019a) the antecedents of voice are likely to be different in the Middle-Eastern work context. We, therefore, conduct this research in the Middle-Eastern work context of the Kingdom of Saudi Arabia (KSA), the largest and wealthiest country in the Middle-East and the biggest oil exporter in the world (Mellahi, 2007).

This study focuses on the KSA work context that discriminates between local and migrant workers who have moved from their country of residence to the KSA for work and constitute one-

third of its working population (Mellahi, 2007). Research suggests that migrant workers in the KSA are considerably less privileged than their Saudi counterparts; for instance, migrant workers often have significantly reduced salaries, bargaining power, job autonomy, job security, and rights to speak up against any supervisory abuse (Arain *et al.*, 2019a). This complicated work relationship among local and migrant workers and the fact that it remains under-explored makes the KSA work context an interesting research setting to extend the established LMX-voice research in a number of important ways.

First, the extant LMX literature focuses on the direct measure of LMX, which refers to employees' self-ratings of their own supervisor's LMX quality. However, we focus on LMX social comparison (LMXSC), which refers to employees' comparisons between their own LMX quality and those of their coworkers (Vidyarathi *et al.*, 2010) and examine its relationships with employees' promotive and prohibitive voice behaviors for at least two reasons. First, LMXSC is more closely linked to the original LMX theory – the vertical dyad linkage approach to leadership proposed by Dansereau *et al.* (1975). According to Vidyarathi *et al.* (2010), LMXSC significantly explained more variance in employees' behaviors (job performance and citizenship behaviors) than LMX. Second, considering the mix of locals and migrant workers in the Saudi workforce, it is likely that employees in the Saudi work context tend to compare their own LMX quality with those of their coworkers (i.e., LMXSC) rather than focusing on just their own LMX quality (i.e., LMX). Thus, this is the first study, to the best of our knowledge that examines the relationships between employees' perceptions of LMXSC and their promotive and prohibitive voice behaviors in the KSA work context.

Second, we also respond to recent research calls to explore potential mediators and theoretical explanations of the LMXSC–performance relationship (Robin Martin *et al.*, 2016;

Robin Martin *et al.*, 2018). To this end, we propose a new self-consistency theory (Korman, 1970) perspective, exploring the mediating role of employees' supervisor-based self-esteem (SBSE) in the relationship between their LMXSCs and their promotive and prohibitive voice behaviors. Employees' SBSE refers to a subordinate's self-evaluation of his/her worth resulting from the relationship with the supervisor (Landry and Vandenberghe, 2009), and emerging research has suggested that this may be a particularly salient and powerful explanation for why supervisors' behaviors, that is, LMXSC, matter for subordinates' task and prosocial performance (Landry and Vandenberghe, 2009; Sguera *et al.*, 2017).

Third, we posit that complicated employee work relationships in the Saudi workforce (i.e., locals versus migrants) are likely to act as a boundary condition for the mediating effects of SBSE in the relationship between LMXSC and employees' promotive and prohibitive voice. We expect that this mediation effect would be stronger for Saudis than for migrants, as the latter would have fewer opportunities and expectations to engage in such constructive voice behaviors, irrespective of their perceived relationship with their supervisors. In exploring this potential moderator, we respond to Morrison's (2014) call for more research to examine the effects of macro-level contextual factors on employees' (promotive and prohibitive) voice behavior.

The remainder of the article outlines five sections as follows: Section 2 theoretically presents the literature review and develops the research hypotheses in order to emphasize the research gap. Section 3 and Section 4 describe the research design introducing the methodology and the main findings of the research. Furthermore, we provide the analytical discussion of the results obtained in Section 5, besides the managerial, practical and theoretical implications. Final considerations with the limitations of the study are pointed out, and future research are drawn in the sixth section.

2 Theoretical Framework and research hypotheses

2.1 Employee Constructive Voice

Liang *et al.* (2012) have categorized employee constructive voice into its promotive and prohibitive forms. Although both promotive and prohibitive voice are forms of constructive voice behaviors that challenge the status quo and benefit the organization (Liang *et al.*, 2012), the ways in which they each do so differ. Promotive voice is future-oriented and positive, and is thus likely to be recognized and interpreted by others, including a supervisor, as a positive behavior. Prohibitive voice, on the other hand, is past-oriented, raises concerns over harmful work-related issues that have affected (or that could affect) the organization badly, and is more negative. It is less certain, therefore, that others, including supervisors, will always interpret these behaviors positively because of the heightened potential for interpersonal conflict and negative emotions that may stem from these contributions (Liang *et al.*, 2012).

Recent voice literature suggests that social media technologies provide a very effective platform for promotive-prohibitive voicing both within (internal voicing) and outside (public voicing) the organization (Bhatti *et al.*, 2020). Holland *et al.* (2016) have highlighted that younger generation employees are likely to use social media for non-work related activities. Particularly, they found a significant and positive relation between job dissatisfaction and voicing, via social media use. There is also evidence that employees use external social media, such as Twitter and exhibit promotive and prohibitive voice issues by posting positive, neutral, and negative tweets (van Zoonen *et al.*, 2016). The social media as external voicing may be more salient when organization's internal mechanism are not effective enough especially in SME contexts where the knowledge creation is facilitated by informal voice mechanisms (Miles and Mangold, 2014; Papa *et al.*, 2018b). Graeme Martin *et al.* (2015), therefore, have suggested internal adoption of

technology by HR to allow employees to voice their concerns to specific stakeholders that enables constructive online dialogue.

Following empirical evidence for the effectiveness of employee constructive voice for promoting positive change in organizations, particularly in organizations using social media and other open channel communications (Scuotto *et al.*, 2017), it is of significant theoretical and practical importance to explore the potential antecedents of employees' promotive and prohibitive voice in modern day organizations. We, therefore, tend to examine employees' LMXSC as an untapped antecedent of employees' promotive and prohibitive voice.

2.2 Leader-Member Exchange Social Comparisons

While most leadership theories suggest that a leader influences their followers' attitudes and behaviors through the collective and equal treatment of all followers, LMX theory (Dansereau *et al.*, 1975) suggests that a leader forms relationships with their followers, and that these relationships differ in terms of quality (Liden and Graen, 1980; Graen and Uhl-Bien, 1995). According to Liden and Graen (1980), a leader's differing low-quality or high-quality relationships with their followers motivate such followers to engage in social comparisons with each other to identify their precise relative standing with their leader/supervisor. Despite this early focus on the social comparison component of LMX, most of the subsequent LMX research, including studies exploring the outcomes of LMX, have tended to focus on individual perceptions of LMX quality. According to Henderson *et al.* (2008), "although individual-level perceptions of LMX quality are reflective of interpersonal social exchange behaviors and motives in the leader-member dyad, they do not capture how the social context arising through within-group LMX differentiation, and the social comparisons occurring in this context, further influence employee attitudes, and behaviors" (p. 1208).

Thus, to capture this within-group LMX differentiation, Henderson *et al.* (2008) measured relative LMX (RLMX), or the degree of difference between one's own LMX and that of their coworkers, and reported that RLMX was positively related to psychological contract fulfillment and subsequent OCBs, after controlling for the effects of individual-level LMX. Vidyarthi *et al.* (2010) measured LMX social comparison (LMXSC), or the comparison between one's own LMX and those of their coworkers, and reported that LMXSC explained around 9% of the additional variance in job performance and OCBs than the variance explained by LMX and other control variables¹. Validating these findings, more recent research has also found a significant and positive effect of LMXSC on employee performance (Xiao *et al.*, 2015), and OCB (Arain *et al.*, 2017). Likewise, this is particularly confirmed in the study of Xiong *et al.* (2019), which recognizes a direct effect between collaborative employee practices and knowledge sharing effects on innovation performance.

Prior research has focused on social exchange theory (Blau, 1964), which suggests that employee perceptions of LMX quality create a feeling of reciprocal obligation to balance the positive exchange with their leaders through increased positive work behaviors (Cropanzano and Mitchell, 2005). However, balancing positive social exchange with the leader is not the only motivational mechanism through which LMX/LMXSC quality may translate into positive employee behaviors, rather other potential explanatory mechanisms, such as self-consistency theory (Korman, 1970), may also provide useful insight (Robin Martin *et al.*, 2018). Thus, in extending this line of inquiry further, we draw attention to employees' SBSE, as an alternative and

¹ Whereas LMXSC and RLMX are both social comparison-based measures of with-group LMX differentiation, the former is a direct and subjective measure (i.e., one's self-evaluation of one's LMX as better than those of others within one's team), while the latter is an indirect and objective measure (i.e., one's LMX minus team mean LMX). Considering that LMXSC is a direct measure of one's subjective judgements of LMX differentiation Vidyarthi *et al.*, (2010), it is likely to be a better predictor of individual level outcomes than RLMX (Martin *et al.*, 2018). As the outcomes of our study, that is, LBSE and employee promotive and prohibitive voice, are measured at the individual level, we chose to use LMXSC to capture the effect of LMX differentiation on these outcomes.

under-explored explanation for the relationship between LMXSC and employees' promotive and prohibitive voice behaviors.

2.3 LMXSC and SBSE

Self-esteem refers to an individual's self-evaluation of his/her worth and competence (Rosenberg, 1965). Prior research suggests that self-esteem is a hierarchical and multifaceted phenomenon that can be built around any social, physical, and moral self, both at the individual and group levels (Pierce *et al.*, 1989; Bowling *et al.*, 2010). Pierce *et al.* (1989) introduced the construct of organization-based self-esteem to refer to, "the degree to which an individual believes him/herself to be capable, significant, and worthy as an organizational member" (p. 25). Bowling *et al.* (2010) found that this specific form of self-esteem explained greater variance in work attitudes and behaviors, including performance than the general form of self-esteem.

While it is useful within an organizational context, the focus of organization-based self-esteem is still broad because it covers all aspects of one's organizational work-life (Landry and Vandenberghe, 2009). Over time, therefore, organizational research has begun to identify more specific forms or sources of self-esteem. Given a supervisor's status and power within work units, much attention has been paid to employees' potential to make evaluations of their self-worth based on this key agent and relationship (Lord and Brown, 2001). Thus, in parallel to the notion of organization-based self-esteem, Landry and Vandenberghe (2009) drew upon the self-consistency theory and conceptualized SBSE as employees' self-evaluations of their worthiness resulting from the relationship with their supervisor.

According to the self-consistency theory (Korman, 1970), individuals derive their self-worth from their daily experiences of social interactions with significant others at work. The key

agent or significant other in most organizations is their immediate supervisor, given the supervisor's direct and indirect influence over employees through the giving and withholding of resources, rewards, and opportunities (Sguera *et al.*, 2017). Thus, given the salience of this relationship, when an employee has a supervisor who encourages, supports, and treats them well, they tend to evaluate themselves as worthy of him/her. The limited extent of SBSE-focused research has tended to support these proposals. For example, Sguera *et al.* (2017) reported a significant and positive relationship between employees' perceptions of supervisory support and their SBSE. Arain *et al.* (2017) suggested that employee perceptions of LMX quality have a positive and significant association with their leader-based self-esteem (i.e., SBSE). In line with the self-consistency theory, therefore, we posit that employees' perceptions of high LMXSC, where they feel that they have a better relationship with their supervisor than most others in their workgroup (Vidyarthi *et al.*, 2010), may result in them holding more positive SBSE.

The following hypothesis is thus proposed:

H1: Employee perceptions of LMXSC are positively related to their SBSE

2.4 SBSE and Employee Promotive and Prohibitive Voice

Self-consistency theory also suggests that once positive self-esteem becomes a part of an employee's self-concept, the employee tends to "engage in and find satisfying those behavioral roles which maximize their sense of cognitive balance or consistency" (Korman, 1970; p. 32). The self-esteem literature suggests that employees with positive self-esteem, both organization-based (Pierce *et al.*, 1989) and SBSE (Sguera *et al.*, 2017), tend to engage in positive work behaviors that help them remain consistent with their positive self-esteem (Pierce and Gardner, 2004). Thus, Bowling *et al.* (2010) indicated that organization-based self-esteem had a positive association with

a variety of positive employee work attitudes and behaviors. Although based on a more limited body of research, SBSE has also been reported to have a positive association with positive employees' work attitudes and behaviors such as OCBs (Sguera *et al.*, 2017) and in-role performance (Arain *et al.*, 2017), and a negative association with negative behaviors such as counterproductive work behaviors (Sguera *et al.*, 2017).

Thus, building on the self-consistency theory and these empirical findings, we suggest that employees' SBSE will be related to their promotive and prohibitive voice behaviors positively, and will explain the relationship between their perceptions of LMXSC and their promotive and prohibitive voice behaviors. We argue that an employee's belief that their supervisor trusts them and relies on them (high SBSE) (Landry and Vandenberghe, 2009) motivates them to be consistent with the positive SBSE by voicing their ideas and suggestions to increase the efficiency and effectiveness of their team and supervisor (promotive voice), and to raise concerns over work-related issues that may harm the efficiency and effectiveness of their team and supervisor (prohibitive voice). Thus, we hypothesize as follows:

H2: Employee's SBSE is positively related to their promotive and prohibitive voice and mediates the positive relationship between LMXSC and their promotive (H2a) and prohibitive voice (H2b).

2.5 Moderating Effect of Employee Nationality

Morrison's (2014) review of the literature on voice and silence identified a number of potential inhibitors of employee constructive voice, including a climate of fear, perceived job futility, career risks, and high power distance. Many of these voice inhibitors are potentially pertinent to the working experiences of migrant workers in Saudi organizations. For example, migrant workers are

not eligible for Saudi nationality, they cannot have their own businesses, and they cannot change their jobs without the consent of their Saudi employers or sponsors (Arain *et al.*, 2019a). These contextual factors make migrant workers powerless against the frequently reported abuse by their employers for which limited or no protection is provided in and by the country's legal system. The ongoing strict compliance with the *Saudization* programs has also created a climate of job insecurity and uncertainty for many migrant workers, with many reporting little hope of finding (alternative) work in other Saudi organizations (Mellahi, 2007).

Given that prior research suggests that employees' feelings of powerlessness and job insecurity may inhibit their constructive voice, particularly prohibitive voice (Chamberlin *et al.*, 2017), we expect that despite perceiving high LMXSC and the resultant high SBSE that may stem from this positive interpersonal relationship, migrant workers in the KSA may be less motivated to exhibit constructive voice than their Saudi counterparts as the wider labor market context and relationship with their Saudi employers mitigate this rather risky prosocial activity (Mellahi, 2007). Prior empirical studies that compare employee voice among samples of locals and migrants have consistently highlighted the fact that migrant employees are less likely to engage in constructive voice than are local employees (Loi *et al.*, 2014). Thus, considering that migrant workers in the KSA have lesser job security, benefits, and career progression opportunities than their local counterparts, we expect that the mediation effect of SBSE in the relationship between LMXSC and promotive and prohibitive voice will be stronger for local Saudis than for migrants.

Thus, we hypothesize as follows:

H3: Employees' SBSE is positively related to their promotive and prohibitive voice and mediates the positive relationship between LMXSC and their promotive (H3a) and prohibitive (H3b) voice, but this is only significant for local Saudi nationals.

3. Research Design and method

Using convenience sampling and a supervisor-employee dyadic design, data were collected by distributing hard copies of two different questionnaires – one for a supervisor and one for his/her employee – at several domestic and international companies in the KSA. As we collected data from both Saudis and migrants, the questionnaires were produced in both English and Arabic. Arabic translation of our chosen measures that were all originally validated in English was carried out using both forward and backward translation. The supervisor's questionnaire comprised measures of their employees' promotive and prohibitive voice behaviors. The employees' questionnaire consisted of measures of LMXSC and SBSE. Both questionnaires were coded so that they could be "matched" later and, which enabled the most valid and reliable assessment of each variable while also reducing the threat of common method variance and self-report bias (Podsakoff *et al.*, 2012).

Business undergraduate students personally distributed 630 supervisor-supervisee questionnaires to several public and private organizations operating in the telecommunication, oil and gas, manufacturing, tourism, and hospitality sectors in the KSA. All participants were working in professional white collar jobs. We first contacted and recruited employees who completed the employee's questionnaire and named their supervisors in their responses. We then approached the supervisors who were named by the employees and asked them to complete a survey that rated their named employees' promotive and prohibitive voice behaviors. Once both questionnaires were completed, we used the codes to pair them. Each supervisor rated only one employee's promotive and prohibitive voice behaviors. We used this strategy (1) to avoid placing an undue

burden on supervisors who were completing questionnaires for multiple employees, which may have affected the quality of their response, and (2) to rule out the possibility of within-group differences in voice rating for multiple employees rated by the same supervisor. All the participants provided the requested data voluntarily, and the research team assured them of the confidentiality of their responses.

After discarding 29 cases with mismatched dyads and missing values, we collected 341 matched dyads, which presented a response rate of approximately 59%. The names of the respondents were erased during the data entry process to ensure anonymity. Among the participating supervisors, 69% were local Saudis and 31% were migrants. Among the local Saudi supervisors, 76% were male, their average age was 37.51 years, and the average supervisor-employee relationship tenure was 3.13 years. Among the migrant supervisors, most respondents were from Egypt (19%), the Philippines (14%), Pakistan (12%), India (11%), Lebanon (10%), and Yemen (10%). Of these, 80% were male, their average age was 37.22 years, and the average supervisor-employee relationship tenure was 3.03 years. Among the employees who participated, 54% were local Saudis and 46% were migrants. Among the local Saudi respondents, 65.6% were male, the average age was 31 years, and the average experience was 4.57 years. The migrant workers were from Yemen (20%), the Philippines (18%), Egypt (15%), Pakistan (13%), and India (12%). Of these, 77% were male, the average age was 33 years, and the average experience was 4.57 years.

3.1 Measures

Unless stated otherwise, all questions were measured on a Likert scale ranging from 1 (not at all) to 7 (a great extent).

LMXSC was measured using the 6-item scale developed by Vidyarthi *et al.* (2010). This scale measures employees' subjective judgment of the social comparisons of their LMX quality with those of other members of their group/team. The alpha reliability value reported for this scale was .94.

SBSE was measured using the 8-item scale developed by Landry and Vandenberghe (2009) and then further validated in a recent study by Sguera *et al.* (2017). The alpha reliability value reported for this scale in this study was .95.

Promotive and prohibitive voice behaviors were measured using the 5-item scales for each developed by Liang *et al.* (2012). The alpha reliability value reported for both voice behaviors was .94.

Supervisor age, gender, nationality (Saudi or migrant), and the relationship tenure with the reported employee were used as *control variables*. Supervisee gender, age, nationality, and work experience were used as control variables because of their likely effect on employees' voice (Liang *et al.*, 2012; Morrison, 2014). Employee promotion-prevention regulatory focus – the two strategic orientations that regulate an employee's cognition and behavior toward the achievement of positive outcomes and the avoidance of negative outcomes, respectively (Higgins, 1998), were reported as significant dispositional predictors of promotive and prohibitive voice (Lin and Johnson, 2015). Therefore, we measured employee promotion and prevention focus using 4- and 3-item scales, respectively. These scales were developed by Lockwood *et al.* (2002). We also controlled for their effects on employees' promotive and prohibitive voice behaviors.

4. Results

Confirmatory Factor Analysis

Before testing our main hypotheses, we carried out CFA on the main model variables to confirm their independence by using the structural equation modeling software AMOS version 23. In line with convention, we used a combination of fit indices – Comparative Fit Index (CFI), Tucker-Lewis Index (TLI), Standardized Root Mean Square Residual (SRMR), and Root Mean Square Error of Approximation (RMSEA) – to assess the adequacy of our model and compared our hypothesized model with a number of reasonable alternative measurement models (Bentler and Bonett, 1980). The CFI and TLI scores above .90 and SRMR and RMSEA scores below .70 were judged as confirming a model with good fit (Hair *et al.*, 2010).

We tested four alternative models. Model 1 is our hypothesized 4-factor model comprising separate scales for LMXSC, SBSE, and promotive and prohibitive voice. Model 2 is a 3-factor model where promotive and prohibitive voice are combined into a single factor. Model 3 is an alternative 3-factor model where LMXSC and SBSE are combined into a single factor. Model 4 is a 1-factor solution where all items for all scales are loaded onto a single factor. Table 1 confirms that our hypothesized model (Model 1) provides an excellent fit for the data (CFI = .97, TLI = .96, SRMR = .04, and RMSEA = .06) and all other alternative models provide a poor fit for the data. Given these results, and the good Cronbach alpha reliability scores across all our measurement scales, we proceeded with the rest of our analysis.

*****Insert Table 1 Here*****

4.1 Descriptive Statistics

All subsequent analyses were conducted using SPSS version 25 and the PROCESS macro version 2.16.3. Table 2 presents the means, standard deviations, and inter-correlations of our model variables. As expected, our key independent and dependent variables correlated in the predicted directions. For example, employees' perceptions of LMXSC were positively correlated with their SBSE ($r^2=.42, p<.01$), and promotive ($r^2=.18, p<.01$) and prohibitive voice ($r^2=.25, p<.01$). Employees' SBSE were positively correlated with their promotive ($r^2=.32, p<.01$) and prohibitive voice ($r^2=.18, p<.01$). As a result, we continued to test our model.

Table 2 provides a summary of our potential control variables and their associations with our main dependent variables, namely SBSE and promotive and prohibitive voice. It seems, in our sample at least, that only employees' and supervisors' ages and employees' promotion focus are positively correlated with one or more of our dependent variables. Consequently, to test the most parsimonious model, we only controlled for these three variables in the rest of our analysis.

*****Insert Table 2 Here*****

4.2 Model Testing: Mediation Model (H1 and H2)

To test hypotheses 1 and 2, we ran the PROCESS Model (Hayes, 2018). Table 3 presents a summary of these findings. As predicted, employees' perceptions of LMXSC were positively related to their SBSE ($B=.23, t=7.21, p<.001$). It appeared that as employees' comparative evaluations of their supervisor relationship improved, so did their SBSE. Hypothesis 1 was thus supported.

Employees' SBSE was positively related to their promotive voice ($B=.37, t=3.71, p<.001$) and mediated the relationship between their perceptions of LMXSC and their promotive voice ($\gamma=.08, [.03, .15]$). Hypothesis 2a was thus supported. Against expectations, employees' SBSE was not significantly related to their prohibitive voice ($B=.17, t=1.27, ns$) and consequently did not mediate the relationship between their perceptions of LMXSC and their prohibitive voice ($\gamma=.04, [-.02, .10]$). Hypothesis 2b was not supported.

As employees' comparative evaluations of their relationships with their supervisors improved, so did their willingness to engage in constructive feedback and suggestions to enhance organizational effectiveness (promotive voice) and, at least in part, this was explained by a greater SBSE. Conversely, while these positive LMXSC perceptions also had a similar – if not stronger – relationship with employees' engagement in more critical feedback to the organization on their current failings and problems (prohibitive voice), this was not explained by their SBSE. Whereas recent research has suggested that employee core self-evaluation (i.e., SBSE) would be less strongly related to employees' prohibitive voice behavior than their promotive voice behavior, it still suggested a significant relationship (e.g., Chamberlin *et al.*, 2017). Our findings suggest more significant differential effects of core self-evaluations such as SBSE on employees' promotive and prohibitive voice behaviors.

*****Insert Table 3 Here*****

4.3 Model Testing: Moderated-Mediation Model (H3)

To test Hypothesis 3, we ran PROCESS Model 14. Table 4 provides a summary of these findings. As predicted, the relationship between employees' SBSE and their promotive voice behavior was only significant for local Saudi employees ($B=-.35, t=-2.12, p<.05$) (see also Figure 2). The

indirect relationship between employees' perceptions of LMXSC and their promotive voice via their SBSE was only significant for local KSA employees ($\gamma=-.08$, $[-.18, -.00]$) (see Table 5). Hypothesis 3a was thus supported. As predicted, the relationship between employees' SBSE and their prohibitive voice behaviors was only significant for local KSA employees ($B=-.56$, $t=-2.50$, $p<.05$) (see Figure 3). The indirect relationship between employees' perceptions of LMXSC and their prohibitive voice via their SBSE was only significant for local Saudi employees ($\gamma=-.13$, $[-.25, -.03]$) (see Table 5). Hypothesis 3b was also supported.

5. Discussion

Our research set out to test the hypotheses that were derived from the self-consistency theory (Korman, 1970). We tested whether employees' SBSE mediated a positive relationship between their perceptions of LMXSC and their promotive and prohibitive voice behaviors and whether these indirect relationships are the same for nationals and migrants working in the KSA. We found strong support for our model. As predicted, employees' perceptions of LMXSC are positively related to their SBSE. In line with the self-consistency theory, it appears that positive relations with the supervisor and, more importantly, the perception that one has of a particularly good relationship with one's supervisor when compared with the relationships between one's colleagues and their supervisors promotes a self-belief in employees that their supervisor relies on them and that they are worthy of this attention (Landry and Vandenberghe, 2009).

We found that employees' SBSE is positively related to their promotive voice behavior. However, we did not find a similar relationship with employees' prohibitive voice behavior. SBSE is an important predictor of employees' voice behavior associated with the communication of new and creative ideas to improve individual, team, and organizational performance, but not of voice behavior associated with more critical feedback on negative individual, team, and organizational

norms and practices that may threaten the performance and survival of the firm. These differential effects of SBSE on promotive and prohibitive voice behaviors support the recent propositions of Chamberlin *et al.*, (2017), who suggested that employee core self-evaluation would be a more important predictor of promotive rather than prohibitive voice. They also argued that core self-evaluations such as SBSE help, “orientate employees toward the attainment of positive outcomes rather than the avoidance of negative outcomes” (p. 40). Core self-evaluations such as SBSE are more promotion-oriented and are thus more likely to strongly influence more promotion-oriented behaviors such as promotive voice. Our findings support these propositions and thus support the ongoing calls for additional research to explore the differential antecedents of promotive and prohibitive voice behaviors.

Finally, as predicted, we found that the indirect relationship between employees LMXSC – SBSE – and both promotive and prohibitive voice behaviors were only significant for the local Saudis in our sample. While the perceptions of LMXSC did have a positive effect on their SBSE, it did not translate into higher promotive or prohibitive voice behaviors. It appears, as predicted, that for this group, the wider work and labor market context may be inhibiting their desire and/or opportunities to raise their voice in whatever form. Studies have shown that migrant workers are less likely to engage in constructive voice than the local employees (Loi *et al.*, 2014). We argued that the Saudi context, in which work experiences and expectations of migrant workers may be negatively affected by the ongoing national policy to promote more Saudis to key jobs and professions (Mellahi, 2007) is likely to inhibit this willingness to engage in voice behaviors further, irrespective of their perceptions of the comparative quality of their relationships with their supervisors. The quality of interpersonal relationships that migrants have with their supervisors cannot overcome a work climate that is insecure, uncertain, and (potentially) discriminatory, and

thus makes it too risky, and inhibits the enactment of both promotive and prohibitive voice behaviors.

5.1 Theoretical and Empirical Contributions

This study makes a number of important theoretical and empirical contributions to the literature on LMXSC and constructive voice. First, we provide, to the best of our knowledge, the first empirical test of the effects of LMXSC on promotive and prohibitive forms of constructive voice behaviors, extending leadership-constructive voice research in general and LMX-constructive voice research in particular. Drawing on early definitions and conceptualizations of LMX, we add to the growing body of work that highlights the importance of comparative LMX and its potential predictive influence over important employee attitudes and behaviors (Henderson *et al.*, 2008). It seems that within-group differences in LMX ratings in addition to actual LMX ratings constitute a key antecedent of employees' voice, and future research needs to keep recognizing this (Vidyarthi *et al.*, 2010).

Second, we contribute to the growing voice literature that demands research on the differential effects of supervisor or leader behavior on promotive and prohibitive voice behaviors (Chamberlin *et al.*, 2017). In line with Chamberlin *et al.*, (2017), we found that LMXSC was positively related to both employees' promotive and prohibitive voice behaviors. However, counter to Chamberlin *et al.*, (2017), it appears that the employees' LMXSC in our study is more strongly related to their prohibitive rather than promotive voice. It appears, therefore, that prohibitive voice – in this context at least – is viewed as a similarly positively orientated behavior as a promotive voice (perhaps even more so) and is thus as likely to be predicted by positive leadership behaviors such as LMXSC.

Finally, we extend the research on the potential mediators and moderators of the LMXSC and constructive voice relationship. As expected, employees' SBSE mediated the relationship between employees' LMXSC and both their promotive and prohibitive voice behaviors – but only for local Saudis. Thus, to the best of our knowledge, we provide the first application of and support for a new self-consistency theory lens for understanding the relationships between employees' LMXSC and their voice behaviors. Given the specific context of our findings – that is, the rather complex KSA labor market – we call for more research in different national and industry contexts to explore the role of employees' SBSE in the relationships between their LMXSC and voice, and thus test the salience of the self-consistency theory as an alternative theoretical lens to understand the implications of positive supervisor-employee interpersonal relationships.

5.2 Practical Implications

Despite these methodological limitations, our research delivers important practical benefits for organizations, particularly international organizations that employ large numbers of migrant workers alongside a national workforce. It appears from our research that while positive comparative supervisor relationships are important for migrant SBSE, it does not translate into migrant voice behaviors. This is a significant problem to be competitive especially in cross-cultural and international organizational contexts, it is essential that they establish digital communication lines in own workplaces in order to receive constructive feedback from all their employees and not just nationals, irrespective of whether this feedback is promotive or prohibitive (Tian *et al.*, 2021). Employee voice and silence have been shown to predict organizational learning, innovation performance and value creation (Malik *et al.*, 2017; Papa *et al.*, 2018a), and strategic agility consistently with knowledge intensive management practices (Xing *et al.*, 2020; Christofi *et al.*, 2021), thus, engendering the voice of all is a key objective of employers and their HR functions

(Malik *et al.*, 2019). Organizations cannot simply rely on their line managers and their effective development of strong interpersonal relations with their team members, in particular, their migrant worker team members, to secure their voice engagement. It appears that the wider labor market and the organizational context may also matter influencing the performance in human intensive work system (Varma *et al.*, 1999). Migrant workers need to feel secure in their jobs and valued by their organizations and not just by their line managers if they are to engage in the essential voice behaviors that organizations desire (Morrison, 2014). That said, for nationals (in this context), LMXSC is a potentially important predictor of employees' voice behaviors, and this is because positive LMXSC perceptions improve employees' SBSE. For organizations, therefore, it is important that their managers understand the importance of this key dyadic relationship and that employees feel that they have a good relationship with their line manager when compared to their peers. Managers may be made aware of this through any number of organizational communication channels such as company handbooks, memos, and even formal training and leadership development programs. One way organizations can ensure effective communication among managers and employees is to adopt and diffuse communication technologies such as social media that ease the barriers of communication that reduce the risk of knowledge hiding at different top-down and bottom-up levels (Ma *et al.*, 2020). They also need to monitor the quality of this essential relationship through their ongoing communications, annual performance reviews, and other mechanisms such as annual staff surveys (Graen and Uhl-Bien, 1995).

6. Conclusion

Our study set out to examine the role of employees' SBSE in the relationship between their LMXSC and both promotive and prohibitive voice behaviors, and whether (or not) these relationships were different for migrants and locals working in organizations in the KSA. We

found support for our model and for the self-consistency theory as a new and important theoretical lens for examining the implications of employees' LMXSC. We recommend international organizations to establish digital communication lines considered as perceived digital support that sustain employee's engagement and mediating their promotive-prohibitive voice directly heard by HR department throughout social exchange comparisons (Biswas *et al.*, 2013). We recognize some limitations of our research although there are practical insights from our findings for large multinationals that recruit large numbers of migrant workers to work alongside nationals. We call on LMX scholars to carry out new research in new contexts that can test and extend these findings further.

6.1 Limitations and Future Research

Our findings must be interpreted in light of some methodological limitations. First, our model suggests relationships between our core variables – specifically, that employees' perceptions of LMXSC cause an effect on their SBSE that, in turn, can cause an effect on the voice behaviors. However, one could also imagine that an individual with a greater SBSE may subsequently rate their managers' LMXSC more highly. Moreover, one could imagine that an employee who is given opportunities to provide voice may rate his/her relationship with his/her line manager more positively. Our cross-sectional design does not allow us to reject these alternative models effectively. Although our hypothesized model aligns with our theoretical framework and past LMX and LMXSC research (Robin Martin *et al.*, 2018), we call for future longitudinal, diary-based, and/or experimental research that may be better able to test these causal relationships accurately. Second, our study was carried out in a very specific national context, that is, the KSA. This was deliberate and was done so in order to test specific hypotheses pertaining to the importance of LMXSC for both migrant and local employees. However, the KSA is a particular

context and their national policies of Saudization may be fairly unique globally. Thus, our study may not be easily generalizable to other national contexts where large migrant communities work alongside nationals. The relative importance of employees' perceptions of LMXSC and SBSE for their voice behaviors in these alternative contexts is thus still unknown, although we hope that our research provides some new insight into these questions. We call for more research in new national contexts that explore the (potential) differential effects of employees' LMXSC and SBSE on migrant and local employees' voice behaviors.
